

Weekly Report

Work

- We fix a bug in our AMTG system. The time selected by time brush is not the time we brush in system.
- We are still computing AMTG in a smaller time step (1 hour). Users are able to select time step (1 hour or 2 hour).
- I attend ChinaVis this week. I think the sensor data from physical space is playing an important role in smart city. Though visualization is used to presentation data in many company's project, visual analytics will be center of data analysis. We are able to deal with emergency in time with the help of visual analytics.

Plan for next week

The AMTG system is almost completed. Time step (1 hours) and some color encoding will be finish as soon as possible.
